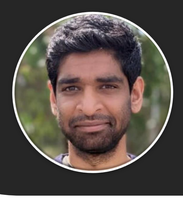
Making Biomedical Research Software FAIR with FAIRshare



Bhavesh Patel

Sanjay Soundarajan

FAIR Data Innovations Hub, California Medical Innovations Institute, San Diego, CA, USA

We all agree, biomedical research software must be made reusable

- Biomedical research software (Python scripts, R code, Jupyter notebooks, etc.) are integral part of research projects
- Making them reusable is therefore crucial to:

Ensure reproducibility of research results

Increase the pace of scientific progress

Cool, what's the problem then?

- No actionable guidelines are available to make software reusable!
- The FAIR Principles for research software (FAIR4RS) only provide a general framework to optimize reusability
- 4,000+ biomedical-related repos created on GitHub in 2021:

97% No license specified

100% No high-level metadata files

Solution: FAIR-BioRS guidelines

- First actionable guidelines for making biomedical research software FAIR as per the FAIR4RS Principles
- Based on a review of relevant literature and resources (including NIH guidelines)

Step 1: Follow best practices during development
E.g., work from **GitHub**, include a **README** doc, etc.

↓

Step 2: Collect files to share
Include the **source code** when possible

↓

Step 3: Include metadata files
Include the standard **codemeta.json** and **CITATION.cff** metadata files

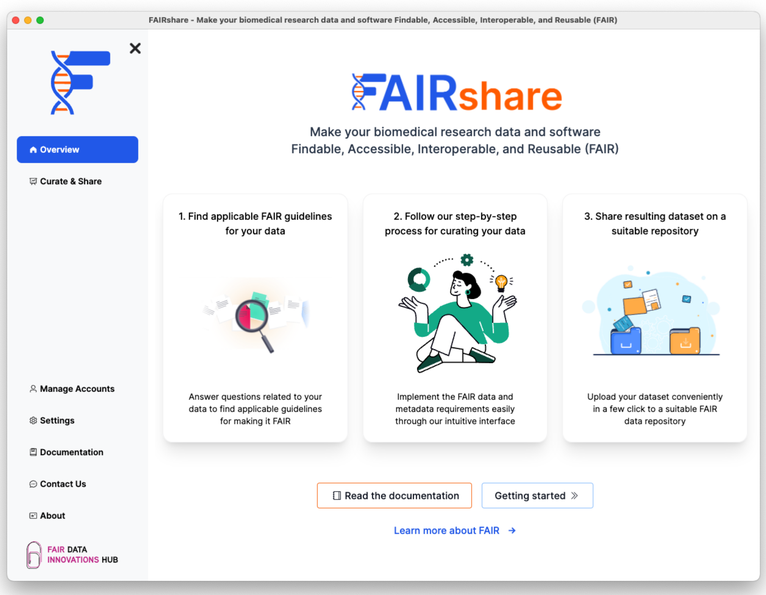
↓

Step 4: Choose a license
Use an **OSI-approved license**, preferably MIT or Apache 2.0

↓

Step 5: Share software on a repository
Share on **Zenodo** or **Figshare** to obtain a DOI and make your software citable

Details are available in our preprint:
https://doi.org/10.1101/2022.04.18.488694



Like a tax filling tool but for "filling" FAIR research software and data

User-support tool: FAIRshare

Open source, free cross-platform desktop software

Goal: Simplify the process of implementing the FAIR-BioRS guidelines for researchers

How? Guide users through the process step-by-step via an intuitive user interface

Include automation to take-over time-consuming and complex tasks
